1 Grading Aspects

The project goal is to read into, understand, and apply, or organize a report on a cryptographic topic. We consider the following aspects when grading the report or the chosen implementation when appropriate. In assessing project report or implementation, students must refer to the grading aspects as guidelines, not as stict rules. The instructors, upon proper consideration, may apply certain amount of flexibility and adjustment while adhering to fairness.

1.1 Documentation

The points for the documentation equal the total points for the project if the chosen topic does not require an implementation. Otherwise, the documentation contributes 50% with the remaining 50% coming from the implementation.

Correctness/appropriateness: 60 points

- Has the overall topic been described reasonably and correctly?
- Have the described method and/or the topic parts been described reasonably and correctly?
- If present, have own results, been described reasonably and correctly? If the task did not ask for own results, are the structure or the focus parts reasonable and coherent?
- Are chosen/designed illustrations, tables, etc., correct and reasonable for the topic?
- Have illustrations, tables, etc. been chosen/designed well to help understanding?
- Are the references correct and appropriate/helpful for the topic?

Organization and clarity: 20 points

- General: Are the topic and the goals of the report presented clearly?
- Introduction: Is a clear and graspable introduction into the topic given, preferably from a high- level to a lower-level description?
- Method/Topic
  - Are all parts of the method or the topic described clearly?
  - Is the organization logical?

- Concluding part: Is the summary, conclusion, and/or discussion clear? Does the conclusion match what the introduction has promised?

Form: 20 points

- Overall format: Does it adhere to the format of the template (length, font, margins, etc.)?
- Illustrations, tables, plots: Do they adhere to the format, e.g., margin, readability, etc.?
- Typography: Is the documentation free of typographic and grammatical mistakes?
- Referencing
  - Are all tables, illustrations, etc., referenced in the text?
  - Are the references/citations correct?

Difficulty/work investment bonus: up to 15 points

- For the choice of difficult topics or subtopics, or other notable investment into the report

1.2 Implementation

The points for the implementation will be 50% if a topic with an implementation part has been chosen.

Functionality/correctness: 70 points

- Does the provided implementation run or compile?
- Does the provided implementation deliver an appropriate subset of the task, given the scope of the project?
- Does the provided implementation run with correct outputs?

Form: 30 points

- Structure/libraries: Does the provided implementation adhere to the task restrictions (e.g., when the task allowed only open-source libraries)?
- Free of warning: Does the project adhere to the programming standard rules (or does it produce warnings)?
- Organization/Clarity: Are sources organized in a clear, reasonable, and coherent manner?

Difficulty/work investment bonus: up to 30 points

- Are reasonable working functionality tests provided?
- Does the provided implementation deliver a significantly larger subset of the task?
- Does the provided implementation deliver exceptional functionality of the task?
